DETAILED ACTION

1) Applicants' election without traverse of invention I and species of product of claim 1, in the reply filed on 7/13/2006, is acknowledged.

Claim 2 is withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention, there being no allowable generic or linking claim.

Claims 18-21 are cancelled.

Claim Rejections - 35 USC § 102

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

2) Claims 1, 3-17, are rejected under 35 U.S.C. 102(e) as being anticipated by Hermans (6,887,348).

The applied reference has 2 common inventors, Troxell, and Baum, with the instant application. Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art under 35 U.S.C. 102(e). This rejection under 35 U.S.C. 102(e)

Art Unit: 1731

might be overcome either by a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this application and is thus not the invention "by another," or by an appropriate showing under 37 CFR 1.131.

Claims 1, 3-12: Hermans discloses a single web product made of pulp fibers produced by conventional wet lay paper making process. The product is a tissue. A softening agent chemical is applied to either or both sides of the tissue. After drying, the tissue is rolled onto reel 24 (col. 11, line 28 to col. 12, line 60). The tissue roll bulk is in the range of about 11.5 cc/g to greater than about 14 cc/g (col. 17, lines 24-34). The tissue fuzz-on-edge, obtained by shear calendering, is in the range of greater than about 1.7 mm/mm to greater than 3.5 mm/mm (col. 17, lines 14-24).

Claim 13: the chemical additive is polysiloxane (col. 12, lines 40-50).

Claim 14: the product Kershaw firmness is in the range of less than 7.8 mm to less than 7.0 mm (col. 17, lines 3-11).

Claims 15-16: the product Kawabata bending stiffness is disclosed in tables of Examples 1, 3 (cols.19-20).

Claim 17: Hermans discloses the product as per above.

In the event any differences can be shown for the product of the product-by-process claim 17, as opposed to the product taught by the reference Hermans, such differences would have been obvious to one of ordinary skill in the art as a routine modification of the product in the absence of a showing of unexpected results; see also *In re Thorpe*, 227 USPQ 964 (Fed. Cir. 1985).
